# Ryan Wong: Changing File permissions in Linux

#### **Project description**

Updated File permissions to ensure least privilege for user, groups and others in the organization.

#### Check file and directory details

The following code demonstrates how I used Linux commands to list the current permissions in the directory.

```
researcher2@5d738f0f927b:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec 2 15:27 .
drwxr-xr-x 3 researcher2 research_team 4096 Dec 2 15:27 ...
-rw--w---- 1 researcher2 research_team
                                         46 Dec 2 15:27 .project_x.txt
drwx--x--- 2 researcher2 research_team 4096 Dec   2  15:27  drafts
                                        46 Dec 2 15:27 project_k.txt
-rw-rw-rw- 1 researcher2 research_team
-rw-r---- 1 researcher2 research_team
                                        46 Dec 2 15:27 project_m.txt
-rw-rw-r-- 1 researcher2 research_team
                                        46 Dec
                                                2 15:27 project_r.txt
rw-rw-r-- 1 researcher2 research_team
                                         46 Dec 2 15:27 project_t.txt
researcher2@5d738f0f927b:~/projects$
```

I used the ls command with the -la option to display a detailed listing of the file contents that also showed hidden files.

### Describe the permissions string

The 10-character string can be deconstructed to determine who is authorized to access the file and their specific permissions. The characters and what they represent are as follows:

- **1st character**: This character is either a d or hyphen (-) and indicates the file type. If it's a d, it's a directory. If it's a hyphen (-), it's a regular file.
- **2nd-4th characters**: These characters indicate the read (r), write (w), and execute (x) permissions for the user. When one of these characters is a hyphen (-) instead, it indicates that this permission is not granted to the user.
- **5th-7th characters:** These characters indicate the read (r), write (w), and execute (x) permissions for the group. When one of these characters is a hyphen (-) instead, it indicates that this permission is not granted for the group.

• 8th-10th characters: These characters indicate the read (r), write (w), and execute (x) permissions for other. This owner type consists of all other users on the system apart from the user and the group. When one of these characters is a hyphen (-) instead, that indicates that this permission is not granted for other.

#### Change file permissions

The organization determined that other shouldn't have write access to any of their files. To comply with this, I referred to the file permissions that I previously returned. I determined project k.txt must have the write access removed for other.

The following code demonstrates how I used Linux commands to do this:

```
researcher2@5d738f0f927b:~/projects$ chmod o-w project_k.txt
researcher2@5d738f0f927b:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec
                                                2 15:27 .
drwxr-xr-x 3 researcher2 research_team 4096 Dec
                                                2 15:27 ...
-rw--w---- 1 researcher2 research_team
                                        46 Dec
                                                2 15:27 .project_x.txt
drwx--x--- 2 researcher2 research_team 4096 Dec
                                                2 15:27 drafts
rw-rw-r-- 1 researcher2 research_team
                                        46 Dec 2 15:27 project_k.txt
                                        46 Dec
rw-r---- 1 researcher2 research_team
                                                2 15:27 project_m.txt
-rw-rw-r-- 1 researcher2 research_team
                                        46 Dec
                                                2 15:27 project_r.txt
rw-rw-r-- 1 researcher2 research_team
                                        46 Dec
                                                2 15:27 project_t.txt
researcher2@5d738f0f927b:~/projects$
```

The first two lines of the screenshot display the commands I entered, and the other lines display the output of the second command. The <a href="chmod">chmod</a> command changes the permissions on files and directories. The first argument indicates what permissions should be changed, and the second argument specifies the file or directory. In this example, I removed write permissions from other for the <a href="project\_k.txt">project\_k.txt</a> file. After this, I used <a href="lsc-la">1s</a> -la</a> to review the updates I made.

## Change file permissions on a hidden file

The research team at my organization recently archived project\_x.txt. They do not want anyone to have write access to this project, but the user and group should have read access.

The following code demonstrates how I used Linux commands to change the permissions:

```
researcher2@3213bbc1d047:~/projects$ chmod u-w,g-w,g+r .project_x.txt
researcher2@3213bbc1d047:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research team 4096 Dec 20 15:36 .
drwxr-xr-x 3 researcher2 research_team 4096 Dec 20 15:36 ...
-r--r---- 1 researcher2 research_team
                                     46 Dec 20 15:36 .project_x.txt
-rw-rw-rw- 1 researcher2 research team
                                     46 Dec 20 15:36 project_k.txt
-rw-r---- 1 researcher2 research_team
                                     46 Dec 20 15:36 project_m.txt
-rw-rw-r-- 1 researcher2 research team
                                     46 Dec 20 15:36 project r.txt
rw-rw-r-- 1 researcher2 research_team
                                     46 Dec 20 15:36 project_t.txt
esearcher2@3213bbc1d047:~/projects$
```

The first two lines of the screenshot display the commands I entered, and the other lines display the output of the second command. I know  $.project_x.txt$  is a hidden file because it starts with a period (.). In this example, I removed write permissions from the user and group, and added read permissions to the group. I removed write permissions from the user with u-w. Then, I removed write permissions from the group with g-w, and added read permissions to the group with g+r.

## Change directory permissions

My organization only wants the researcher2 user to have access to the drafts directory and its contents. This means that no one other than researcher2 should have execute permissions.

The following code demonstrates how I used Linux commands to change the permissions:

```
researcher2@5d738f0f927b:~/projects$ chmod g-x drafts
researcher2@5d738f0f927b:~/projects$ ls -la
total 32
drwxr-xr-x 3 researcher2 research_team 4096 Dec 2 15:27 .
-r--r---- 1 researcher2 research_team
                                     46 Dec 2 15:27 .project_x.txt
drwx----- 2 researcher2 research_team 4096 Dec 2 15:27 drafts
-rw-rw-r-- 1 researcher2 research_team
                                     46 Dec 2 15:27 project_k.txt
-rw-r---- 1 researcher2 research_team
                                     46 Dec
                                            2 15:27 project_m.txt
-rw-rw-r-- 1 researcher2 research_team
                                     46 Dec
                                            2 15:27 project_r.txt
rw-rw-r-- 1 researcher2 research_team
                                     46 Dec
                                            2 15:27 project_t.txt
researcher2@5d738f0f927b:~/projects$
```

The first two lines of the screenshot display the commands I entered, and the other lines display the output of the second command. I previously determined that the group had

execute permissions, so I used the chmod command to remove them. The researcher2 user already had execute permissions, so they did not need to be added.

## Summary

I changed multiple permissions to match the level of authorization my organization wanted for files and directories in the projects directory. The first step in this was using ls -la to check the permissions for the directory. This informed my decisions in the following steps. I then used the chmod command multiple times to change the permissions on files and directories.
